Using GST as a guide, what kind of researcher/person do I become?

- a mercurial researcher?
- an IS researcher?
- a mathematician?

Design research as a way of attacking what I believe in, i.e., systems thinking from a multidisciplinary perspective?
Perhaps I could use language more to
make it seem common conception.

**Example**

"which gets measured gets done" was a
measuring idea that I challenged.

Many people take it for granted,
or at least some people writing on
measuring seem to take it for granted.

Secretly, I take it for granted as well,
but hiding as an interpretative scientist,
I can pretend that I am investigating
such obvious ideas and try to figure
out whether they are true or not.
